

# Deep Stimulation for Deep Pain Relief

The IF II™ is a portable, easy to use, interferential stimulator that effectively treats acute and chronic joint injuries and targets specific areas for effective pain relief. When using four electrodes, the IF II offers “true” interferential stimulation. When using two electrodes, the unit can deliver a “premixed” medium frequency. Either way, patients receive the benefits of medium frequency—deep penetration, increased localized circulation and pain control.

## THE IF II OFFERS THESE OUTSTANDING BENEFITS

### *Choice of frequency shift options*

The IF II offers four frequency options, allowing the clinician to program the device for customized deep tissue rehabilitation and pain management therapy.

### *Portable, safe and easy to use*

Unlike most interferential devices, the IF II is portable and easy to use. Because it is battery operated, the patient can perform most

activities while wearing the device. As a safety feature the IF II's amplitude knobs recess to prevent the stimulator from accidentally increasing or decreasing its intensity.

## ADDITIONAL BENEFITS

- Ideal for use in acute and chronic joint injuries such as the shoulders and knees. Exceptional at treating pain in specific areas such as the neck and low back
- Medium frequency encounters less skin impedance so more stimulation gets deeper into the tissue
- Increases localized blood flow to help decrease edema and increase range of motion

## COMMON APPLICATIONS

- Joint sprains/strains
- Osteoarthritis
- Tendonitis/bursitis
- Neck and low back pain
